

R for Beginners - R Code File -2

This R code book has been written by [Rohit Dhankar](https://github.com/RohitDhankar) . GitHub - <https://github.com/RohitDhankar>

This is the 2nd in series of R Code Files.

Refer GitHub Repository , for all Data Files -> <https://github.com/RohitDhankar/R-Beginners-Online-Virtual-Learning-Session>

Its a good practice from time to time to keep a track of our current Working Directory and list out all the Objects in our R ENVIRONMENT - specially so when we are committing changes to a Git Remote.

VECTOR Operations

```
getwd()
```

```
## [1] "/home/dhankar/Desktop/R_Own/Proj_1"
```

```
#
```

```
ls()
```

```
## character(0)
```

We could remove any object with command - rm("Object Name")

We can also use print() , to view any objects stored value.

```
# Code Section -1

Going further with VECTORS .

We combine two or more vectors to get another vector .

ATTACH and DETACH Datasets

To OPERATE upon an inbuilt DATASET we need to LOAD it into R .

In lay-man terms , we may equate this to our earlier - `read.csv()` , but there are subtle differences.

The ATTACH will pull in a Data Set from the DataSet Package into our R Search Path.

```
# Code Section -21
```

```
?attach()
```

```

## Quoting below from inbuilt HELP -
## The database is attached to the R search path. This means that the database is

```

```
# searched by R when evaluating a variable, so objects in the database can be accessed
# by simply giving their names.
```

```
?detach()
```

```
# # Quoting below from inbuilt HELP -
# # Detach a database, i.e., remove it from the search() path of available R objects.
# Usually this is either a data.frame which has been attached or a
# package which was attached by library.
```

```
# Another Function which will help automate is - zap()
```

```
# library(epicalc)
# ?zap()
# https://artax.karlin.mff.cuni.cz/r-help/library/epicalc/html/zap.html
```

```

# To access MULTIPLE COLUMNS - 2,4 and 6 of the DF.
```

Lets create a New Directory - Files Folder from within R and house our basic introductory graphs there - we use - `dir.create()`

```
# Code Section -25
```

```
#dir.create("/home/dhankar/Desktop/R_Own/Plots/Intro_2/", recursive=TRUE) # to be RUN only Once
```

Plots and Graphs - the Basics

Over the next couple of sections we shall preview the basics of Plots and Graphs.

If we were to execute the code from the following sections , in the Console- the Graphs would not appear inline but would appear within the PLOTS pane of R Studio or in certain cases as POP Up's.

HISTOGRAM an Introduction

```
# Code Section -26
```

```
# So what exactly is a HISTOGRAM -
```

```
# " estimate of the probability distribution of a continuous variable (quantitative variable)"
```

```
# Source -- Wiki -- https://en.wikipedia.org/wiki/Histogram
```

```
hist(df_1$Cost.Price,col.main="blue",col = "green")
```

Histogram of df_1\$Cost.Price

```
#  
hist(df_1$Sales.Price,col.main="blue",col = "orange")
```

Histogram of df_1\$Sales.Price

par() Function - Multiple adjacent plots

```
par{graphics}
```

Next sections we look at some basic usage of the par() function , with it we can create a matrix of n rows X n columns - of various plots and graphs

```
# Code Section -27
```

```
##?par() # Uncomment for Help
```

```
opar <- par(no.readonly=TRUE)
```

```
par(mfrow=c(2,1)) # 2 - ROWS , 1 - COLUMN - Filled in by ROWS # or we may use - mfc=col=c() , to fill by
```

```
hist(df_1$Cost.Price,col.main="blue",col = "green")
```

```
hist(df_1$Sales.Price,col.main="blue",col = "orange")
```

Histogram of df_1\$Cost.Price

Histogram of df_1\$Sales.Price

```
# Next lets try - sub-plot in 2 COLUMNS and 1 ROW
```

```
opar <- par(no.readonly=TRUE)
```

```
par(mfrow=c(1,2)) # 1 - ROW , 2 - COLUMNS
```

```
hist(df_1$Cost.Price,col.main="black",col = "yellow")
```

```
hist(df_1$Sales.Price,col.main="black",col = "red")
```

Histogram of df_1\$Cost.Price

Histogram of df_1\$Sales.Price

```
#
opar <- par(no.readonly=TRUE)
par(mfrow=c(2,2)) # 2 - ROWS , 2 - COLUMNS
plot(df_1$Date.of.Invoice,df_1$Sales.Price,col=c("red","yellow"))
hist(df_1$Cost.Price,col.main="black",col = "yellow")
plot(df_1$Date.of.Invoice,df_1$Cost.Price,col=c("green","yellow"))
hist(df_1$Sales.Price,col.main="black",col = "red")
```

LAYOUT of Plots - beyond the par()

```
# Code Section -28
## The same set of PLOTS as earlier now formatted
# with Layout inplace of par()

##layout()

layout(matrix(1, 2, byrow = TRUE),widths = c(4,1),heights = c(4,1))

plot(df_1$Date.of.Invoice,df_1$Sales.Price,col=c("green","yellow"))
```

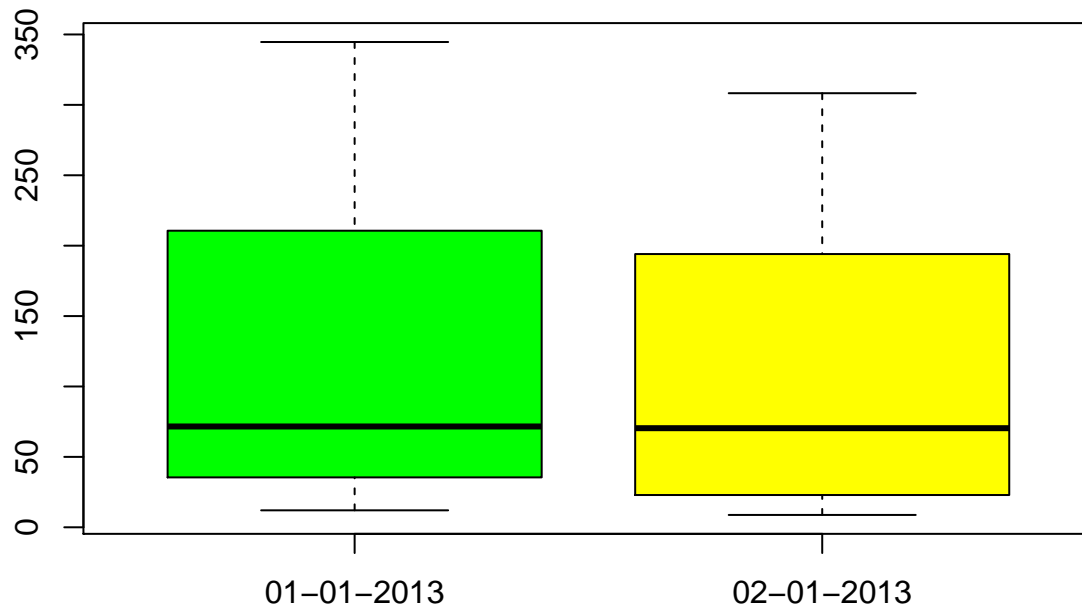

```
hist(df_1$Cost.Price,col.main="blue",col = "yellow")
```

Histogram of df_1\$Cost.Price

```
plot(df_1$Date.of.Invoice,df_1$Cost.Price,col=c("green","yellow"))
```

```
hist(df_1$Sales.Price,col.main="black",col = "red")
```

#
# If no dependent variable exists, either type of variable can be plotted
# on either axis and a scatter plot will illustrate only the
# degree of correlation (not causation) between two variables.
#
# VERY VERY VERY Important - NOT CAUSATION ... so how do we
# ascertain CAUSATION , we shall see within this text soon.

##### Next Section Lets Look at CORRPLOTS --- or  
# Correlation Plots for all Variables with all the Other Variables
```

Looking at these FOUR Scatter Plots we can now have a basic level discussion about - CORRELATION amongst different variables in any given Data Set.

We have chosen to have - variable “a1” on the X Axis of all Four Plots .

Plot_A - Var “a1” and “a3” seem to be Highly Correlated . As values of “a1” increase the values of “a3” decrease.

Plot_B - Var “a1” and “a5” seem to be Slightly Correlated . As values of “a1” increase , some of the values of “a5” decrease.

Plot_C - Var “a1” and “a6” seem to be Highly Correlated . As values of “a1” increase the values of “a6” decrease.

Plot_D - We are not able to draw any inference for Correlation.
